Open Data at the World Bank: 2 Years Old Today
Shaida Badice | Posted on 20 Apr 2012

Today is the second birthday of the Bank’s Open Data Initiative.

To mark the occasion, we’ve created a new blog specifically aimed at discussing data and open data issues related to development. And I’m going to use the opportunity of this first post to briefly look back and recap what’s been achieved, and – more importantly – to outline some of the plans we have for moving ahead. </tr>
</tbody>
</table>
### Population, total

Total population is based on the de facto definition of population, which counts all residents regardless of legal status or citizenship—except for refugees not permanently settled in the country of asylum, who are generally considered part of the population of their country of origin. The values shown are midyear estimates.

In charts

Population growth (annual %)

Annual population growth rate for year t is the exponential rate of growth of midyear population from year t-1 to t, expressed as a percentage. Population is based on the de facto definition of population, which counts all residents regardless of legal status or citizenship—except for refugees not permanently settled in the country of asylum, who are generally considered part of the population of the country of origin.
Mobile cellular subscriptions (per 100 people)

Mobile cellular telephone subscriptions are subscriptions to a public mobile telephone service using cellular technology, which provide access to the public switched telephone network. Post-paid and prepaid subscriptions are included.

How we Classify Countries

For operational and analytical purposes, the World Bank’s main criterion for classifying economies is gross national income (GNI) per capita. In previous editions of our publications, this term was referred to as gross national product, or GNP. (Learn more about this change in terminology.) Based on its GNI per capita, every economy is classified as low income, middle income (subdivided into lower middle and upper middle), or high income. Other analytical groups based on geographic regions are also used.

A short history

The Bank’s analytical income categories (low, middle, high income) are based on the Bank’s operational lending categories (civil works preferences, IDA eligibility, etc.). Learn about the history of operational guidelines.

Group definitions

These tables classify all World Bank member countries (187), and all other economies with populations of more than 30,000 (215 total).

Geographic region: Classifications and data reported for geographic regions are for low-income and middle-income economies only. Low-income and middle-income economies are sometimes referred to as developing economies. The use of the term is convenient; it is not intended to imply that all economies in the group are experiencing similar development or that other economies have reached a preferred or final stage of development. Classification by income does not necessarily reflect development status.

Income group: Economies are divided according to 2010 GNI per capita, calculated using the World Bank Atlas method. The groups are: low income, $1,005 or less; lower middle income, $1,006 - $3,975; upper middle income, $3,976 - $12,275; and high income, $12,276 or more.
Methodologies

Below are the methodologies used by the World Bank to compile statistical data. They cover information from indicator definitions to aggregation rules and other World Bank processes in collecting data.

Data Consistency

Differences in timing and reporting practices may cause inconsistencies among data from different sources, so users should be cautious when combining these data.

Our comprehensive publications World Development Indicators and Global Development Finance contain data that generally rely on official sources, although some adjustments are made in the balance of payments to account for fiscal/calendar-year differences. Within these publications we attempt to present data that are consistent in definition, timing and methods. Even so, updates and revisions over time may introduce discrepancies from one edition to the next.

National accounts and balance of payment data come from two sources: current reports gathered by the Bank’s country management units and data obtained from official sources. The Country at a Glance tables may present data that differ from those reported in official sources.

Change in Terminology

Following statistical practice, the World Bank has adopted the following terminology in line with the 1993 System of National Accounts (SNA). The changes in terms are listed below.

<table>

Structure of the Economy

Economies vary in the composition of activities, the extent of integration into international trade and capital markets and how resources are distributed across individuals within the economy. Statistics are drawn from the International Monetary Fund's Balance of Payments database and International Financial Statistics, the UN Commission on Trade and Development, the World Trade Organization, and various other sources.

Data from World Bank

*(http://tinyurl.com/y76cvj3)*

Twitter  Facebook  Delicious  E-mail
The mission of the World Bank’s Development Data Group is to provide high-quality national and international statistics to clients within and outside the Bank and to improve the capacity of member countries to produce and use statistical information. As part of the international statistical system, the Data Group works with other organizations on new statistical methods, data collection activities and statistical capacity-building programs. This group also coordinates the analytical and statistical work related to monitoring progress towards the Millennium Development Goals.
